b = random.randint(1,100)

c1 = a+b
c2 = a*b
c3 = a/b
c4 = a-b
print(f"Sum of {a}+{b} = {c1} ")
print(f"Multi of {a}*{b} = {c2} ")
print(f"Division of {a}/{b} = {round (c3,2)} ")
print(f"Sub of {a}-{b} = {c4} ")
```

Sum of 74+28 = 102
Multi of 74*28 = 2072
Division of 74/28 = 2.64
Sub of 74-28 = 46

```
In [8]: # wap ask the user take the radius find the area of circle
# pi=3.14
# r=100
# area_of_circle=pi*r*r
# Example take pi value from math package
# r value using random
import random,math

r = random.randint(1,100)
pi = math.pi
area_of_circle=pi*r*r

print(f"Area of circle is {round (area_of_circle,2)} and radius is {r} ")
```

Area of circle is 113.1 and radius is 6

```
In [9]: # wap ask the user take height and breadth find the area of traingle
# area_of_traingle=0.5*b*h
h = eval(input("Enter a height of Triangle : "))
b = eval(input("Enter a bright of Triangle : "))
area_of_traingle=0.5*h*b
print(f"Area of Triangle is {area_of_traingle} and bright {b} or hieght {h}")
```

Area of Triangle is 391.0 and bright 34 or hieght 23

```
In [11]: # wap ask the user take 3 numbers find the average

a = eval(input("Enter a first Number :"))
b = eval(input("Enter a second Number :"))
c = eval(input("Enter a thrid Number :"))

average = (a+b+c)/3

print(f'Average of {a},{b}, and {c} : {round (average,2)} ')
```

Average of 12,23, and 45 : 26.67

```
In [13]: # wap ask the user take the bill amount and tip amount calculate total bill

bill_amount = eval(input("Enter a bill amount : "))
tip_amount = eval(input("Enter a bill amount : "))

total_bill = bill_amount + tip_amount
print("Total Bill:",total_bill)
```

Total Bill: 239

```
In [1]: # wap ask the user take the salary, percetage of tax calculate tax amount

salary = eval(input("Enter a Salary :"))
tax = 10
tax_amount = salary*10/100

print("Text Amount is ", tax_amount)
```

Text Amount is 2000.0

```
In [2]: # wap ask the user take the value in dollar convert into rupees
#       1$=80rs
dollar = eval(input("Enter a dollar:"))

rupee = 80 * dollar

print("Convert into Rupee :",rupee)
```

Convert into Rupee : 400

```
In [7]: # wap ask the use take weight in kgs convert into pounds
#       1kg=2.2pounds

weight = eval(input("Enter a weight :"))
pounds = 2.2 *weight

print("Convert ito pound :",round (pounds,3))
```

Convert ito pound : 94.6

```
In [ ]: # 3.time
# sleep
# time
```

```
In [14]: import time
help(time.sleep)
value=time.sleep(3)
print("hello")
```

Help on built-in function sleep in module time:

```
sleep(object, /)
sleep(seconds)
```

Delay execution for a given number of seconds. The argument may be a floating-point number for subsecond precision.

hello

```
In [15]: import time  
         help(time.time)
```

Help on built-in function time in module time:

```
time()  
    time() -> floating-point number
```

Return the current time in seconds since the Epoch.
Fractions of a second may be present if the system clock provides them.
